Océ North America is pleased to recognize our continued partnership with Electronic Systems Protection. ESP manufactures the Digital QC Power Filter that Océ Corporate Printing sells to help customers protect Océ printing devices from damage caused by a severe power surge or lightning hit and to protect the performance reliability through minimizing ground noise. Electronic Systems Protection has continually added additional technology to their products to enhance reliability and protection of Océ Printing solutions.

Some of the protection and benefits customers receive with the Digital QC product include:

- Prevention of damage to Océ printing devices from electrical surges, such as lightning, thereby decreasing ownership costs and extending equipment life.
- Cat5e ETL Verified Network Surge Protection to help ensure trouble-free network connections and maximum signal integrity.
- Fax/Modem DSL Filter that prevents unwanted crossover and reduces radio signal interference (RFI), which can be picked up by unbalanced phone systems.
- UL listed, FCC registered, and Cat5e ETL Verified to guarantee compatibility.

Océ North America is pleased to market the Digital QC solution with all Océ Printing devices by including these options in the Océ sales pricebook and posting information and sales tools about the solution on our corporate intranet website.

Regards,

Tom O'Neill  
Director Product Marketing
